SUMMARY

Software Engineer with ~3 years building and shipping production systems end to end: backend services and high-throughput REST APIs, cloud infrastructure and CI/CD, AI-driven content automation, and web/mobile frontends. At AllThingsSports I designed and maintain the backend for All Things Rugby and The Rugby App (100k+ downloads), delivering 900%+ API performance gains through Redis caching and concurrency-safe design, an automated news and article pipeline with AI-generated content, and an internal CRM/admin platform. Strong in C#/.NET, Python, TypeScript/React and SQL; AWS Certified Solutions Architect – Associate, currently preparing for the Professional certification.

SKILLS

Languages	C#, Python, TypeScript, JavaScript, SQL, Dart, Java, C, C++, Rust, HTML, CSS
Backend	.NET, Node.js, FastAPI, Flask, Spring Boot, REST APIs
Frontend & Mobile	Next.js, React, Flutter, TipTap
Cloud & DevOps	Azure, Azure DevOps, AWS, Docker, Kubernetes, CI/CD
Data	SQL Server, PostgreSQL, MongoDB, Redis, Firebase
AI & Automation	OpenAI GPT APIs, LLM content generation, OpenClaw agent workflows, scheduled workers
Tools	Git, NumPy

EXPERIENCE

Software Developer December 2023 – Present

AllThingsSports · AllThingsRugby · BinYousef Doha, Qatar

Platform & Backend

- Designed and maintain the backend for All Things Rugby and The Rugby App, serving 100k+ downloads with live scores, stats, highlights and news across .NET, SQL, Next.js, Flutter and Firebase.
- Built and optimized high-throughput REST APIs integrating multiple third-party data providers, achieving 900%+ performance gains through Redis and in-memory caching of player and match data, aggregation, and concurrency-safe refresh strategies.
- Architected an internal CRM/admin platform with role-based access (admins, authors), custom tournament management, and complete API data override for matches, fixtures, incidents, stats, media and editorial content.

Content Automation & AI

- Automated the editorial content pipeline: scheduled workers ingest news and live match data, automatically match articles to the relevant matches, teams and news feeds, and generate AI-drafted articles for editors.
- Built an AI-powered article/report generator with selectable GPT models that drafts content from live match data, integrated into a highly customized TipTap editor with smart embeds.
- Deployed and configured OpenClaw, an open-source AI assistant, with custom workflows that monitor live matches through the weekend, alert the team when incoming provider data looks wrong, and generate a daily rugby brief from recent news.

Cloud & DevOps

- Designed the Azure cloud architecture and built the Azure DevOps CI/CD pipelines, automating build, test and deployment across the API, worker and scheduler services.

Frontend & Mobile

- Built the Next.js web and Flutter mobile frontends for the platform, consuming the in-house APIs for live scores, stats, highlights and news.

Software Developer September 2021 – August 2022

SmartICE St. John's, NL, Canada

- Enhanced the performance and scalability of a Laravel and React.js dashboard by integrating Chart.js and optimizing REST API interactions for real-time data visualization.
- Contributed to development and maintenance of three key applications: SmartBUOY, SmartQAMUTIK, and an internal data-visualization dashboard.
- Automated data-processing workflows, enabling seamless data retrieval, analysis, and visualization within the internal dashboard.

PROJECTS

QueryPilot *C#, .NET 8, OpenAI API, SQLite, xUnit, Docker*

AI agent that answers database questions in plain English: the model receives the schema as a tool definition and returns structured output, and every generated query passes a default-deny guard before it can run.

- Guard tokenizes SQL rather than string-matching and rejects anything not provably a single read-only SELECT: stacked statements, comment-based evasion, CTEs wrapping writes, EXEC, SELECT INTO, and tables outside the allowed schema.
- LLM sits behind an interface with a deterministic fake so the full suite runs offline; an adversarial input corpus plus mutation checks prove every guard rule is actually tested.

LLM Context Optimizer *TypeScript, Node.js, Vitest*

TypeScript library, CLI and local HTTP proxy with a seven-stage pipeline (classify, collect, rank, compress, protect, pack, audit) that fits files, diffs, logs and stack traces into a token budget before they reach a model.

- Proxy fronts the OpenAI and Anthropic APIs, rewriting only oversized message arrays and passing everything else, including SSE streams, through byte for byte.
- Four-tier protection model guarantees stack traces and test output survive verbatim; ~3.7k lines with 63 passing tests.

Claude Code & Codex Companion Apps *Flutter, Dart, Rust, Cloudflare Workers · in progress*

Mobile and desktop companions for monitoring and steering AI coding sessions remotely (live activity, change review, action approval and follow-up prompts) while code, terminal access and credentials never leave the developer machine.

- Three-tier design with a clear trust boundary: Flutter client, a Rust desktop bridge that holds everything sensitive locally, and a thin Cloudflare backend for connectivity, notifications, device management and subscriptions.
- Per-machine trusted-device pairing and session reconnection, managing multiple computers from one app.

TaskTracker *C#, .NET 8, EF Core, SQL Server, Azure, Bicep, Docker*

Clean-architecture task management REST API (Domain, Application, Infrastructure, Api) where reflection-based architecture tests fail the build if a layer picks up a forbidden dependency.

- Lifecycle rules enforced in the domain aggregate and surfaced as 409 conflicts; filtering, sorting and paging compose into a single IQueryable executed as SQL.
- Azure infrastructure as code with Bicep (ACR, App Service, SQL) and an OIDC-based deployment workflow.

Book Management System *Java 21, Spring Boot 3, MongoDB, JUnit 5, Docker, AWS*

Personal library API modelled as true documents: server-side Criteria search with paging, and tag facets computed by an aggregation pipeline rather than in application code.

- Allow-listed sort fields, optimistic locking and atomic array operators; tests run against an embedded mongod with no external database.
- Multi-stage Docker build and compose, with a documented AWS ECS/Fargate deployment path.

EDUCATION

Memorial University of Newfoundland and Labrador January 2019 – August 2023

Bachelor of Science in Computer Science · GPA 3.46 · Faculty of Science Dean's List 2022–23

CERTIFICATIONS

- AWS Certified Solutions Architect – Associate (October 2023)
- AWS Certified Solutions Architect – Professional (in progress, target 2026)
